

Example: Failure-Learning System

Challenge: “How might a team learn from project failures without blame?”

A promising bridge combines adaptive immune triage with blameless incident review:

- **Structural mapping:** noisy weak signals ↔ ambiguous project warning signs; independent signal agreement ↔ corroborated timeline/evidence; immune memory ↔ searchable prior-incident patterns.
- **Prototype:** a weekly private signal inbox tags concerns by confidence and impact; escalation occurs only when multiple evidence types agree; a facilitator hosts a blameless review; prevention actions have owners and due dates.
- **Falsifier:** if people report less candidly, or escalation is delayed for genuine high-severity events, abandon or redesign the threshold rule.
- **Success measure:** earlier detection, percentage of actions completed, and anonymous psychological-safety score.
